

Day 2 Catch-Up Guide.

Use this guide if you missed Day 2. Complete it in order after your Day 1 foundation passes its completion check.

Your Day 2 finish line.

- At least two real project files exist inside `current-projects/` .
- Each project names an outcome, owner, useful number, deadline, blocker, and dated next milestone.
- Your platform master file exists at the root of `MY BIZ BRAIN` .
- Your memory folders exist and point back to real source files.
- A fresh conversation passes the cold memory test.
- The five Standard Agency Intelligence skills are installed and the receipt reports `5/5` behavioral self-tests passed.
- At least one skill has been tested on a small report sample with known answers.
- `SESSION-HANDOFF.md` records the finished Day 2 state.

This guide follows what was actually built during the live Day 2 session: Active Projects, the memory system, the Standard Agency Intelligence skill pack, a report test, and the optional discussion about GitHub and team access.

Do not use this guide to build a morning brief, live operating view, custom agency workflow, or automated upkeep system. Those were part of the planned agenda, but they were not completed in the live Day 2 build.

The working rule.

The conversation is not the brain. The folder and its files are the brain. Use the same method from Day 1:

Fresh conversation. Same folder. One job. One saved result.

For every phase:

1. Start a fresh conversation connected to `MY BIZ BRAIN` .
2. Paste the prompt for that phase.
3. Answer one question at a time in your normal words.
4. Confirm the named files exist inside the folder.
5. Run the test prompt.
6. Correct the result and update the files before continuing.

Stay in the same conversation while completing and correcting one phase. Start a fresh conversation for the next phase and for every cold test.

DAY 2 PROGRESS TRACKER

- ☐ **00** Reopen the Day 1 workspace and verify the handoff
- ☐ **06** Active Projects. Creates files in `current-projects/`
- ☐ **07** Pre-index cleanup. Resolves duplicates, conflicts, and stale files
- ☐ **08** Memory System. Creates the platform master file and memory folders
- ☐ **09** Cold memory test. Proves a fresh conversation can find the truth
- ☐ **10** Standard Agency Intelligence skills. Installs five report skills
- ☐ **11** Known-record report test. Proves one skill works on a real sample
- ☐ **12** Day 2 handoff. Updates `SESSION-HANDOFF.md`
- ☐ **13** Final Day 2 completion check

Reopen the brain.

Step 00: Verify the Day 1 handoff.

Day 2 begins in a fresh conversation connected to the same `MY BIZ BRAIN` folder.

PASTE THIS EXACT PROMPT

Read `SESSION-HANDOFF.md` and verify that every file named in it actually exists. Then read `about-me.md`, `brand-voice.md`, `working-preferences.md`, `content-strategy.md`, and `team-members.md`.

Give me a concise Day 1 status with:

1. Files that exist
2. Phases that were tested
3. Anything incomplete or contradictory
4. The exact next phase

Do not begin the next phase. Do not change any file. Do not fill missing information with assumptions.

PASS BEFORE CONTINUING

- The AI finds the real Day 1 handoff.
- The five Day 1 foundation files exist.
- The response identifies Active Projects as the next phase.
- Any missing or contradictory information is shown clearly.

If the handoff has a different name

Some Day 1 handoffs were saved with a session number in the filename. If yours was, point the AI to the exact file and keep one standard filename going forward.

My Day 1 handoff is named [EXACT FILE NAME]. Read that file and verify the files it names. Do not rename or replace anything yet. After the verification, tell me whether it should become the current SESSION-HANDOFF.md or remain as a dated archive. Wait for my approval before changing any file.

If the handoff is missing or wrong

Do not rely on the prior conversation. Inspect the workspace directly. Tell me which of the five Day 1 files exist, which required information appears to be missing, and what must be repaired before Active Projects. Do not change files until I approve the repair list.

Do not continue until the Day 1 foundation is visible and the correct workspace is connected.

Give the brain real work.

Step 06: Active Projects.

This is where the brain stops being a biography and starts carrying current work. A project is not a topic. It has:

- A real outcome
- An owner
- One useful number
- A current value, or a visible missing-data label
- A deadline or decision window
- A blocker
- A dated next milestone

Create at least two project files. Choose work that is active now and worth reviewing every week. Good agency examples include:

- | | |
|--------------------------------|---|
| 01 Retention campaign | 05 Hiring a producer or service team member |
| 02 Cross-sell or bundling push | 06 Renewal season preparation |
| 03 Life production push | 07 Book acquisition |
| 04 Win-back campaign | 08 Office move or team restructure |

The examples are prompts for your thinking. Do not let the AI choose your priorities for you.

Choose the projects first

If you do not already know which projects deserve files, use this prompt before the build prompt.

Read about-me.md, working-preferences.md, and team-members.md. Help me identify the two or three active projects that deserve files first.

A project must have:

1. A real outcome
2. A current owner
3. A useful success number
4. A deadline or decision window
5. A next milestone

Ask me one question at a time. Look for the work creating the most operating friction, financial exposure, missed follow-up, or team confusion. Recommend the smallest set that would remove the most friction. Do not create any project file until I approve the list.

PASTE THIS EXACT PHASE 6 PROMPT

Run this once for each approved project.

Create a file in current-projects/ for this project: [NAME IT]. Interview me, then write it with these sections: what it is and why it matters; current status; the one number that matters and where it stands today; milestones and deadlines; who is involved; open decisions; what is blocking it. End the file with "Next milestone:" on its own line so it is always visible at a glance.

Replace [NAME IT] with the real project name before sending the prompt.

Make a shallow project operational

If the first project file is vague, use this follow-up in the same conversation.

Before you finalize this project file, interview me more deeply one question at a time.

Force clarity on:

1. The specific result that would make this project complete
2. Why it matters now
3. The one number that best shows movement
4. The current value, target value, source, and reporting period for that number
5. Who owns the next move
6. The deadline and what created it
7. The next decision that only I can make
8. The current blocker
9. The earliest visible sign that the project is off pace
10. The exact next milestone and its date

Separate facts, estimates, assumptions, and missing information. Do not invent a current number or target. When the interview is complete, show me the revised project file before saving it.

If you cannot choose the one number

Do not choose a vanity metric for me. Ask what decision this project is meant to improve, what behavior or business result should change, and what evidence we can measure consistently. Give me no more than three candidate measures, explain the tradeoff in plain language, and recommend one. Wait for my choice.

If the current value is unknown, write `Current value: Missing` and name the source needed to establish it. Missing information is better than an invented number.

If the project needs a report

Keep the raw report outside `MY BIZ BRAIN`. Point the AI to its local path, answer one approved question, and save only the distilled finding inside the project file.

Analyze the report at [LOCAL FILE PATH] for the approved question below. Do not move, alter, or copy the raw report into MY BIZ BRAIN. Show the source period, definitions, exclusions, missing fields, and calculations. Then write only the approved findings and next action into [PROJECT FILE].

Approved question: [QUESTION]

Test the project files

Review every file in current-projects/. Give me a short project review with: project, owner, current status, one number, next milestone, deadline, blocker, and open decision. Do not invent missing fields. Flag incomplete files.

Repair an incomplete project

This project file is not operational yet. Identify every vague, unsupported, or missing field. Ask me only the questions required to establish the owner, one number, deadline, blocker, and next milestone. Update the file only after I approve the corrected facts.

PASS BEFORE CONTINUING

- At least two real project files exist in current-projects/ .
- Each file states a real outcome and owner.
- Each file names one useful number and its source.
- Unknown values are labeled missing.
- Each file has a deadline, blocker, and dated next milestone.
- The project review test names no unsupported facts.

Build durable memory.

Step 07: Run the pre-index cleanup.

The platform master file will become the table of contents for the business. Clean the workspace before building that index.

Start a fresh conversation connected to the same folder.

PASTE THIS CLEANUP PROMPT

Before building the master index, audit the files in this workspace. List:

1. Duplicate files
2. Conflicting facts
3. Missing source files
4. Files whose names or paths are unclear
5. Information that appears stale

Ask me one question at a time to choose the source of truth for each conflict.
Do not merge, rename, delete, or rewrite anything until I approve the audit.

Work through the audit carefully

The audit may find old handoffs, duplicate project files, stale starter documents, or information that no longer matches the current business.

Do not answer `yes to all` unless you understand every proposed change. Approve one group of changes at a time. Never let the AI delete a file because it merely looks old.

PASS BEFORE CONTINUING

- Every duplicate has a deliberate keep, archive, merge, or remove decision.
- Every factual conflict has one approved source of truth.
- No file was deleted or overwritten without your approval.
- The AI can identify the current project files and Day 1 foundation files by exact path.

Step 08: Build the memory system.

The master file is an index, not a storage closet. Every line should state a core fact or point to the file containing the detail. The filename is different by platform.

CLAUDE AND COWORK

CLAUDE.md

CODEx

AGENTS.md

The platform master file must sit at the root of `MY BIZ BRAIN`. The memory system also creates:

- `memory/people/`
- `memory/projects/`
- `memory/context/company.md`
- `memory/glossary.md`

CLAUDE AND COWORK PROMPT

Build my memory system. First, read every file in this folder. Then create CLAUDE.md at the root as an INDEX, not a dump: one line on who I am; my team as a table; my active projects with one-line statuses; my four safety rules; key terms; and a pointer line for every other file in the folder. Every line must either state a core fact or point to the file with the detail. Then create memory/ with people/ (one file per team member, seeded from team-members.md), projects/ (one file per active project), and context/company.md (my carrier situation, tools, and how the agency runs). The glossary.md from my starter pack is already in memory/. Read it, then walk me through it so I can cut, correct, and add terms. When done, tell me to start a fresh session for the load test.

CODEX PROMPT

Build my memory system. First, read every file in this folder. Then create AGENTS.md at the root as an INDEX, not a dump: one line on who I am; my team as a table; my active projects with one-line statuses; my four safety rules; key terms; and a pointer line for every other file in the folder. Every line must either state a core fact or point to the file with the detail. Then create memory/ with people/ (one file per team member, seeded from team-members.md), projects/ (one file per active project), and context/company.md (my carrier situation, tools, and how the agency runs). The glossary.md from my starter pack is already in memory/. Read it, then walk me through it so I can cut, correct, and add terms. When done, tell me to start a fresh session for the load test.

Review the glossary one term at a time

The starter glossary is a starting point. Your agency may use a term differently, and internal campaign names or team shorthand will not be there yet.

Walk me through glossary.md one term at a time. For each term, ask me to choose: KEEP, CORRECT, or REMOVE.

If I keep or correct it, ask how the term is actually used in my agency and whether our definition differs from a carrier, industry, or software definition. After the existing list, interview me for internal shorthand, campaign names, team nicknames, carrier abbreviations, scorecard language, and any word that would be misunderstood outside this agency.

Do not add a term until I approve its exact definition.

Audit the master file as an index

Run this after the memory build finishes.

Audit the master file as an index. For every section, tell me whether it contains a core fact, a valid pointer, unnecessary detail, a broken path, or unsupported information. Recommend the smallest corrections. Do not turn the master file into a copy of the detailed files.

Review and approve the smallest corrections. Open the master file and inspect the paths yourself.

PASS BEFORE CONTINUING

- The correct platform master file exists at the root.
- It acts as an index rather than a copy of every source file.
- Its team and project pointers resolve to real files.
- All four safety rules appear.
- The people, projects, context, and glossary memory files exist.
- The glossary reflects your language, not just the starter definitions.
- The master-index audit finds no broken paths or unsupported facts.

Step 09: Run the cold memory test.

The memory system is not proven in the conversation that built it. Start a completely fresh conversation connected to the same `MY BIZ BRAIN` folder.

Do not paste the old chat. Do not explain the team member or project first.

Test a person

Before answering, read the workspace master file and follow its file pointers. Who is [TEAM MEMBER], what do they own, and what current context matters when I communicate with them? Cite the workspace file you used.

Test a project

What is the one number, current status, blocker, and next milestone for [PROJECT]? Cite the workspace file you used. If anything is missing, say so.

Replace the brackets with one real team member and one real project before sending the prompts.

Repair a failed cold test

The cold load test failed. Diagnose the failure without guessing. Check whether the correct workspace folder is connected, whether the platform master file is named correctly and sits at the root, whether its pointers match real paths, and whether the fact exists in the source file. Fix only the confirmed problem, then tell me to start another fresh conversation for a second cold test.

Run the test again in another fresh conversation after the repair.

PASS BEFORE CONTINUING

- The test was run in a fresh conversation.
- The AI followed the master-file pointers without being told the answers.
- The team answer matches the source file.
- The project answer names the correct number, status, blocker, and next milestone.
- Missing information stays missing.
- The AI cites the correct local workspace sources.

Install and test the report skills.

Step 10: Install the Standard Agency Intelligence skills.

The supplied skill pack contains five report-analysis skills.

- | | |
|----------------------------|------------------------|
| 01 Agency Quote Conversion | 04 Agency Owner Review |
| 02 Agency Retention Rescue | 05 Agency Cross-Sell |
| 03 Agency Commission Audit | |

These are repeatable analysis methods. They are not your raw agency data.

The installer receipt proves the supplied behavioral self-tests passed. It does not prove that a new carrier export maps correctly. That requires a small test with records you already know.

Prepare the correct platform pack

1. Download the Claude or Codex skill pack for the platform you use.
2. Unzip the download.
3. Open the unzipped folder and your `MY BIZ BRAIN` folder side by side.
4. Copy the included `STANDARD-SKILLS` folder and installer files into the root of `MY BIZ BRAIN`.
5. Start a fresh conversation connected to `MY BIZ BRAIN`.

Do not copy `.DS_Store` or unrelated operating-system files into the brain.

PASTE THIS INSTALL PROMPT

Install all five Standard Agency Intelligence skills from the STANDARD-SKILLS folder for this platform and this MY BIZ BRAIN project only. Run `install-standard-skills.py` with the available Python interpreter. If Python is unavailable, stop and explain that the validated installer could not run. Do not manually overwrite any existing skill folder. Do not create `READY.txt` unless all five skills validate. Do not upload, move, or alter any source agency report.

Inspect the receipt

Do not treat a friendly success message as proof. Open the installation receipt and confirm:

- All five skill names appear.
- The destination matches your current project and platform.
- The receipt reports 5/5 behavioral self-tests passed.
- No existing skill was silently overwritten.

If Python is too old or unavailable

Keep the installation conversation open and send:

Explain this installation error in plain language. Identify the exact Python version the installer found, the version it requires, and the safest supported way to run the validated installer on this computer. Do not bypass the installer, disable validation, or manually copy files into hidden skill folders. Show me the proposed steps before changing anything.

If the repair requires software installation or a system-level change, review the command before approving it.

If a skill already exists

Do not overwrite the existing skill. Compare the installed version with the supplied version. Tell me the version, file differences, and safest update path. Wait for my approval before replacing anything.

PASS BEFORE CONTINUING

- The installer completed without bypassing validation.
- The receipt names all five skills.
- The receipt reports 5/5 behavioral self-tests passed.
- The installed destination belongs to the correct project.

Step 11: Test one skill on a known report sample.

KEEP CUSTOMER DATA OUT OF THE BRAIN

Do not put a raw customer report inside `MY_BIZ_BRAIN`. Keep it in a separate local folder and point the AI to that exact local path.

Do not sync raw customer reports to GitHub or another cloud location through this process.

Start with a small sample containing records whose expected result you already know. This is the only honest way to confirm that the report fields and carrier format were interpreted correctly.

Run the report test

Analyze the small report at [LOCAL FILE PATH] with the appropriate Standard Agency Intelligence skill. Before calculating, tell me the source period, fields you found, definitions you will use, exclusions, missing fields, duplicates, and data-quality warnings.

Create the owner dashboard and local working list. Explain the three most important findings. Reconcile the result against the known answers I provide. Do not send, change, upload, or move anything. Stop if the fields cannot support the requested calculation.

Known answers for this sample: [ENTER THE TOTALS OR RECORDS YOU ALREADY KNOW]

Grade the result

Check at least:

- The source period is correct.
- The record count reconciles.
- Duplicate records are handled correctly.
- Dates appear as dates rather than spreadsheet serial numbers.
- Negative amounts stay numeric.
- Names or notes beginning with spreadsheet formula characters are neutralized in exported CSV files.
- The dashboard and working list agree with the underlying records.
- The three findings are supported by the data.

Do not move from a small test to a full report only because the installer receipt says 5/5 .

Repair a failed report test

The report test did not reconcile. Do not explain the difference with a guess. Show me the exact rows, field mapping, definitions, exclusions, duplicate logic, and calculations that created the mismatch. Separate a bad source file from a bad field mapping or a bad skill rule. Recommend the smallest correction. Do not update the skill until I approve the rule and rerun the same known sample.

Customize an output only after the numbers pass

Stay in the same conversation after the analysis is correct. You may ask for changes to the dashboard labels, colors, sections, visible names, or action-list format.

Do not use visual polish to hide an analysis that has not reconciled.

PASS BEFORE CONTINUING

- One supplied report skill ran on a small known sample.
- The input remained outside `MY BIZ BRAIN`.
- The output stayed local.
- The totals and known records reconcile.
- Data-quality warnings are visible.
- You inspected the dashboard and working list.
- No message was sent and no source report was changed.

Optional sharing and team access.

GitHub is optional.

The live Day 2 session discussed GitHub as a way to move a workspace between devices and keep versions of local files. It is not required to complete the core Day 2 build.

Do not push the full owner brain to GitHub until you have classified what is private, what is team-safe, and what must never leave the local computer.

Run a privacy audit first

Perform a read-only privacy and sharing audit of MY BIZ BRAIN. Classify every top-level file and folder as:

1. Owner-only
2. Team-safe
3. Contains customer or sensitive data
4. Unclear and requires my decision

Identify passwords, credentials, customer reports, compensation information, discipline notes, private management context, and any file that should not be shared or synced. Do not move, copy, delete, publish, or sync anything. Give me the proposed sharing boundary and wait for my approval.

If you decide to use GitHub

Use a fresh conversation and ask for a plan before allowing changes.

I want to use GitHub so I can access an approved version of this workspace from another device. First explain the setup in plain language. Show me exactly which files would be included, which files would be excluded, whether the repository would be private, how credentials and customer data will stay out, and how I would push and pull changes safely. Do not install software, create a repository, sync files, or run terminal commands until I approve the plan.

TEAM ACCESS RULE

Do not give the team the full owner brain by default.

A team-safe knowledge base may need its own folder and its own repository. A searchable RMP library, service process, or sales reference does not require access to owner-only business context.

If someone receives a copy of the full brain, they receive every file inside that copy. Separate access before sharing, not after.

Save the Day 2 session.

Step 12: Create the Day 2 handoff.

The handoff lets the next fresh conversation resume without relying on this chat history. It does not replace the project files, master index, memory files, or installer receipt.

PASTE THIS PROMPT

Update SESSION-HANDOFF.md inside this workspace so a fresh conversation can resume without relying on this chat history.

Read the workspace and summarize only verified information under these headings:

1. Purpose of the brain
2. Work completed in this session
3. Files and folder structure created or changed
4. Active projects, owners, numbers, blockers, and next milestones
5. Memory-system structure and platform master-file name
6. Decisions made
7. Instructions and operating rules
8. Skills installed and the installation receipt result
9. Tests run and what passed or failed
10. Incomplete work
11. Exact current state
12. Where the next conversation should resume

For every completed phase, name the artifact that proves completion. Clearly separate facts from assumptions and missing information. Do not start another phase. Do not claim that a report skill works on my carrier data unless a known sample reconciled. Show me the handoff for review before saving it.

Review the handoff. Confirm that it names real files and honestly records anything unfinished.

Step 13: Run the final Day 2 check.

Start a fresh conversation connected to the same `MY BIZ BRAIN` folder.

Read `SESSION-HANDOFF.md` and verify that every file it names actually exists. Perform a read-only Day 2 completion check. Do not change files.

Confirm whether these artifacts and tests exist:

1. At least two files in `current-projects/`
2. Each project has an outcome, owner, useful number or missing-data label, deadline, blocker, and dated next milestone
3. The correct platform master file exists at the workspace root
4. `memory/` contains `people`, `projects`, `context/company.md`, and `glossary.md`
5. The master-file index has no broken pointers or unsupported facts
6. A fresh-conversation person test passed
7. A fresh-conversation project test passed
8. The Standard Agency Intelligence installation receipt names five skills and reports 5/5 behavioral self-tests passed
9. One small known-record report test reconciled
10. `SESSION-HANDOFF.md` records the current Day 2 state

List anything missing, incomplete, unsupported, or untested. End with either `DAY 2 COMPLETE` or `DAY 2 NOT COMPLETE`. Do not begin another build.

You are caught up when the response says `DAY 2 COMPLETE` and you personally confirmed the named files and test outputs exist.

If it says `DAY 2 NOT COMPLETE`, repair only the missing step. Rerun that step's test, update the handoff, and run the final check again.

Common fixes.

The AI starts explaining the training files

The documents in this folder are reference material. My request is the action to perform. Do not summarize or critique the curriculum. Follow my current request and wait for the next instruction when the requested action is complete.

The AI tries to continue into another phase

Stop after the current artifact and test. Do not begin another phase. Show me the exact files created or changed and wait for my review.

Old files already exist

Do not overwrite anything yet. Compare the current phase requirement with the existing file. Tell me what is complete, what is missing, and what conflicts. Recommend whether to update the existing file or create a clearly named replacement. Wait for my approval before editing.

The AI asks too many questions at once

Continue one question at a time. Ask only what is required to complete the current file and pass its test. Put useful but nonessential questions in a follow-up list at the end.

The AI says the build is done, but files are missing

The step is not complete. Ask it to show the exact local path and open the file. If it cannot, reconnect the workspace and repair only that step.

The master file became too long

This master file is becoming a storage dump. Reduce it to core facts and valid file pointers. Move no information and delete nothing. Show me which sections should remain in the index and which details already belong in source files. Wait for my approval before editing.

A new conversation cannot find the memory

Confirm the correct folder is connected. Then confirm `CLAUDE.md` or `AGENTS.md` is at the root and that its pointer paths match real files.

The installer says success, but no receipt exists

The installation is not proven. Do not copy skills manually. Ask the AI to identify why the validated installer did not create its receipt and repair the confirmed cause.

The report output looks good, but the numbers do not match

The test failed. Use the report-test repair prompt. Do not approve the dashboard or edit the skill until the known sample reconciles.

The AI wants to upload or move the raw report

Stop it. Keep the report in its separate local folder. Point the analysis to the file without moving it into `MY BIZ BRAIN` or a synced repository.

GitHub feels too technical

Skip it. GitHub is optional. The core brain remains usable on the computer where the folder lives.

DAY 2 COMPLETION RECORD

Record this after the final check passes.

DATE COMPLETED	PLATFORM USED
PROJECT 1	PROJECT 2
PLATFORM MASTER FILE	COLD PERSON TEST
COLD PROJECT TEST	INSTALLATION RECEIPT
REPORT SKILL TESTED	KNOWN SAMPLE RECONCILED
HANDOFF REVIEWED	

Your Day 2 build is complete when the folder can carry current work, a fresh conversation can find the right memory, and one installed report skill produces a verified result without moving or changing the source data.
